

AIR POWERUP

TIME SENSE

Common

Claude always knows the real time. No more 'tonight' at noon.

What you unlocked

By default Claude Code learns the date once, when a session starts, and never sees the clock again. So halfway through a long chat it will cheerfully say 'tonight' at noon, or misjudge how long you have been gone. Time Sense fixes that. It quietly stamps every message you send with the current local time, so Claude always knows what time it actually is.

Equip it

Works on **macOS, Windows, and Linux**, one and the same install. Unzip this anywhere, open Claude Code in the folder, and paste the line below. Claude finds your settings, merges the hook, and confirms it, no installer. If the stamp does not show up on your next message, open `/hooks` once (or restart the session) so the config reloads.

```
Install this AIR hook: merge the object in hook/settings-snippet.json into the hooks.UserPromptSubmit array of my settings.json. Keep my other hooks, add this alongside them. Then confirm it is wired.
```

What it does

Right before Claude reads each of your prompts, one small line is injected into context:

Now: Mon, 2026-07-20, 12:55 GMT+3

Weekday, date, 24-hour clock, timezone. From there Claude can name the right part of day, tell how much time passed between your messages, and reason about deadlines and 'by end of day' against the real clock. It costs under ten tokens per message and fires only on your prompts, never on tool output, so it is effectively free.

Made to just work

The hook is a single inline Node command, and Node already ships with Claude Code, so the exact same line runs on every operating system with nothing extra to install. Because it is inline (no separate script file), it also cannot be silently disabled by a stray package.json the way file hooks can. Want a 12-hour clock or seconds? Tweak the `toLocaleString` options in the snippet (the table is in `HOOK.md`). To remove it, delete the entry you added, or just ask Claude to take the Time Sense hook back out.
