VOICEPRINT

Capture how you actually write, then draft anything in your voice.

What you unlocked

Most attempts to make AI 'write like you' fail the same way: you describe your tone and the model hands back a generic average. Voiceprint works the opposite way. It reads **real samples** of how you already write and extracts the concrete patterns that make your writing yours, your openers, your hedges, the punctuation you lean on, the words you would never use. Those patterns become a reusable **profile**. After that, every draft sounds like you.

Equip it

Unzip this anywhere, open Claude Code in the folder, and paste the line below. Claude wires it in for you, no installer.

```
Install this AIR skill: move the `voiceprint` folder into my ~/.claude/skills/ directory, then confirm the voiceprint skill is available.
```

Two modes

Build turns samples into a profile: collect writing, extract the voice DNA, generate a self-contained profile file, and verify it with a live test draft.

Draft uses an existing profile: say what you need written and Voiceprint produces it in your voice, in the right register, ready to send.

The fastest way to feed it

Your **sent folder** is the single richest source of your voice: high volume, every register from clients to close friends, written unguarded. If you have a Gmail or email connection in Claude, just say **'learn my voice from my sent mail'** and Voiceprint reads a spread of it.

No connection? Paste **5 to 15 varied samples** across the situations you actually write in: one cold email, one message to a friend, one client reply, one social caption, one annoyed-but-polite note.

Get the most out of it

Variety beats volume. A wide range of registers teaches more than ten near-identical newsletters.

Never feed it AI-polished text. That captures the model's voice, not yours, the one thing this skill exists to prevent.

Correct the first draft. Tell it what is off; your correction is gold and sharpens the profile.

Reuse the profile everywhere. One file, every future draft, across email, posts, and messages.
